

Overview of diabetes and the most effective control of sugar

**DR. YACOBA ATIASE (FWACP, MAACE, MSC, MBChB, BSc)
Consultant Physician/ Diabetologist , Lecturer UGSMD**

AT THE END OF THIS PRESENTATION.....

Epidemiology of Diabetes

Current thinking of aetiopathogenesis

Advances in management for best glycaemic control

Challenges preventing attainment of good glycaemic control

DISCLOSURES

What is diabetes?

Metabolic disorder characterized by a defect in insulin secretion, insulin action resulting in hyperglycemia and associated with characteristic complications

- Type 1**
- Type 2**
- Gestational**
- Other specific types**

TYPE 2 DIABETES, THE NEW EPIDEMIC

- 2010, 285 million people
- 2012 > 371 million people have DM
- By 2030, 552 million will have diabetes

No country has been left out
Developing countries > developed countries

- Urbanization
- Westernization
- Sedentary life style
- Longevity

Double burden of disease

Number of people with diabetes by IDF Region, 2013

YOUNGER ONSET OF T2DM

WHY?

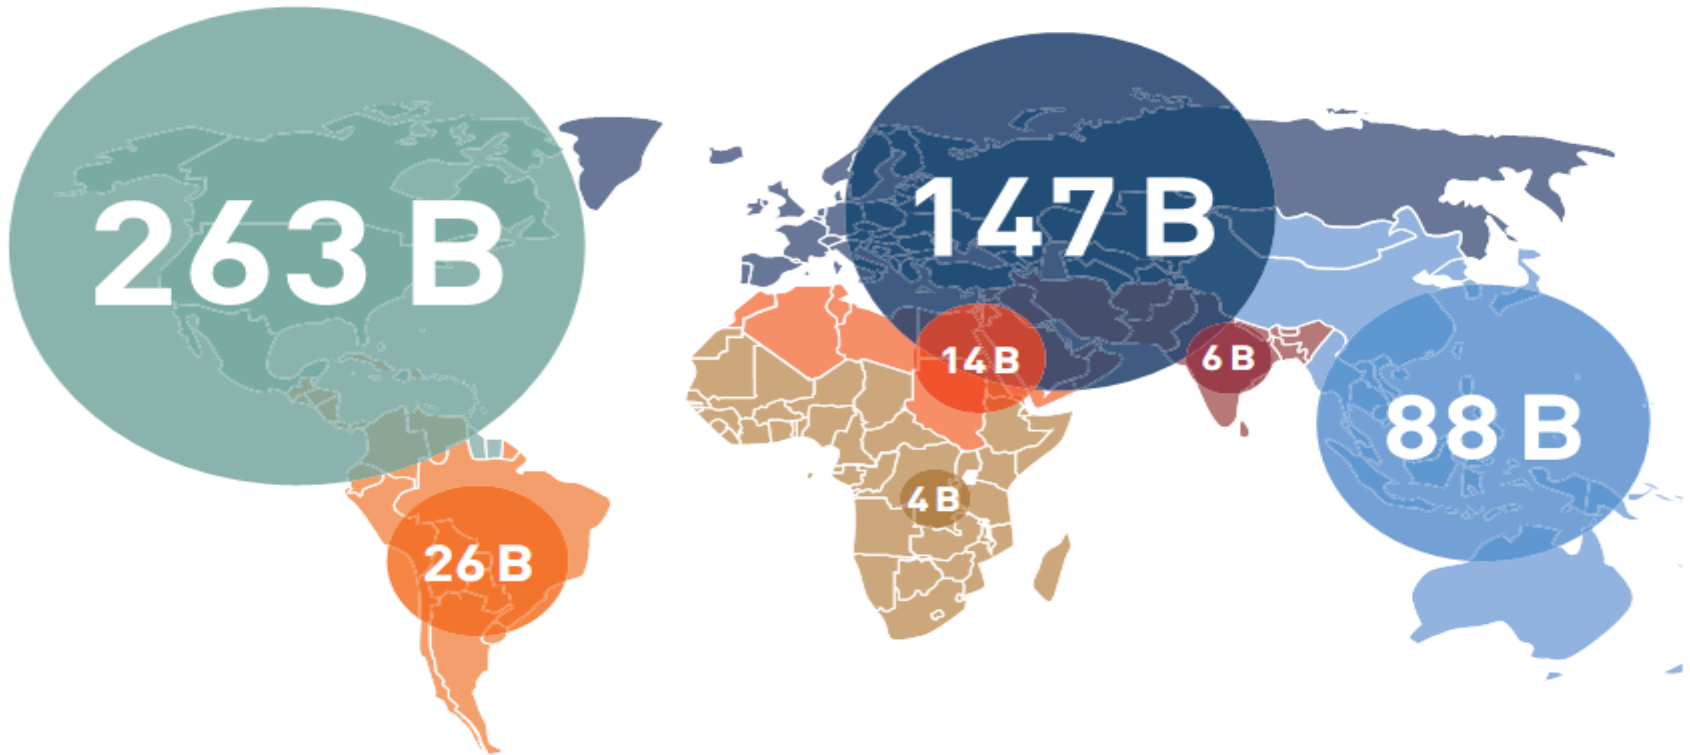

- Sedentary lifestyle – TV, PC (“Nintendo-nization”)
- Energy dense food

Socioeconomic and Public health impact will be greater

- Premature morbidity/mortality
- Prolong exposure of the disease
 - Full gamut of complications in future

ECONOMIC BURDEN OF DIABETES

expenditures

Health expenditure (USD) due to diabetes (20-79 years), 2013

4.8 million people died and 471 billion USD were spent due to diabetes in 2012.

HEALTHCARE EXPENDITURES AND DEATHS PER 1,000 DUE TO DIABETES BY INCOME GROUP

Diabetes on the Rise in Ghana

Dodu SRA, West Africa Med J, 1958

Amoah AG, Owusu SK, Adjei S. Diab. Res. and Clin. Pract. 2002

AETIOPATHOGENESIS OF HYPERGLYCEMIA

Role of insulin

CARBOHYDRATE

- Increases glycogen synthesis
- Decreases gluconeogenesis and glycogenolysis
- Increases glucose uptake in cells

FAT

- Clears triglyceride rich chylomicrons from blood
- Increases lipid synthesis in fat cells by re-esterification
- Inhibits lipolysis

PROTEIN

- Increases uptake of amino acids by cells
- Inhibits protein breakdown

INSULIN RESISTANCE in T2DM

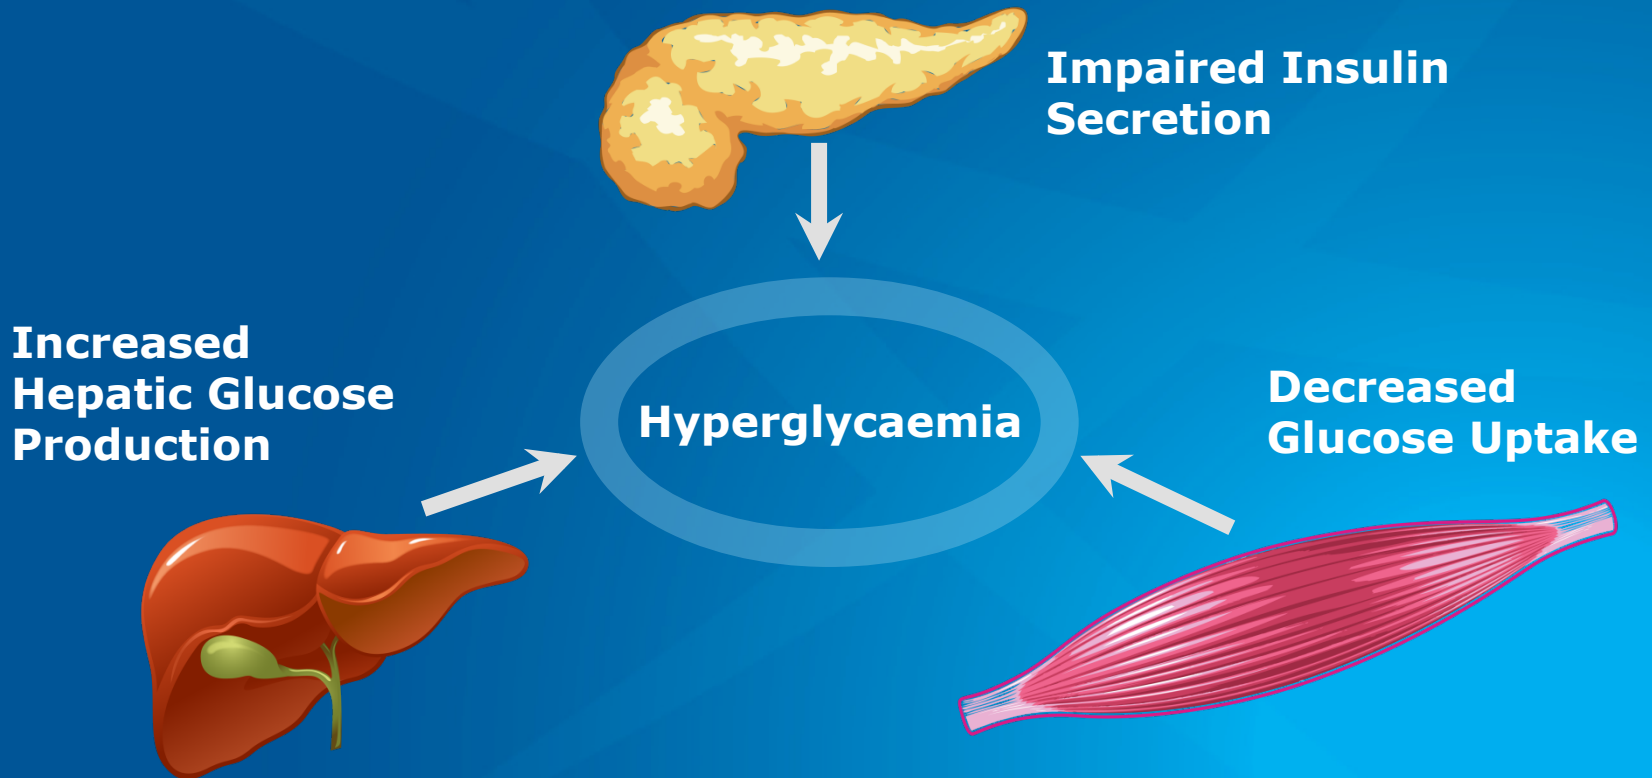

Insulin resistance(IR): A state in which a given level of insulin produces a less than expected biological effect.

Carbohydrate, Fat, protein

METFORMIN, PIOGLITAZONE

Pathogenesis of type 2 diabetes

- ◆ The triumvirate: Insulin resistance in muscle and liver and impaired insulin secretion represent the core defects in type 2 diabetes

Insulin secretion

Basal insulin secretion- rapid pulsatile release of insulin from pancreas

Stimulated insulin secretion- e.g. postprandially,

Phase 1

- Very rapid occurs within 10 mins after eating, preformed

Phase 2

- New insulin is formed, slower, lasts longer

Physiologic Insulin Secretion: 24-Hour Profile

INSULIN SECRETION

1. Gallwitz B, Haring H-U. Diabetes Obes Metab. 2010;12:1-11.
2. Schuit FC, et al. Diabetes .2001;50:1-11.
3. Krentz AJ, Bailey CJ. Drugs. 2005;65:385-411.

Insulin secretory defect in T2DM

Basal insulin secretion

- Frequency and amplitude is reduced

Stimulated insulin secretion

- 1st phase often absent, earliest pathology in T2DM
- 2nd phase insulin secretion is impaired

- **SULPHONYLUREA & MEGLITINIDE**

From triumvirate to ominous octet

In addition to the well-recognised triad, others have been proven

These multiple defects are referred to as the "ominous octet"

4. Disharmonious quartet (fat cells)

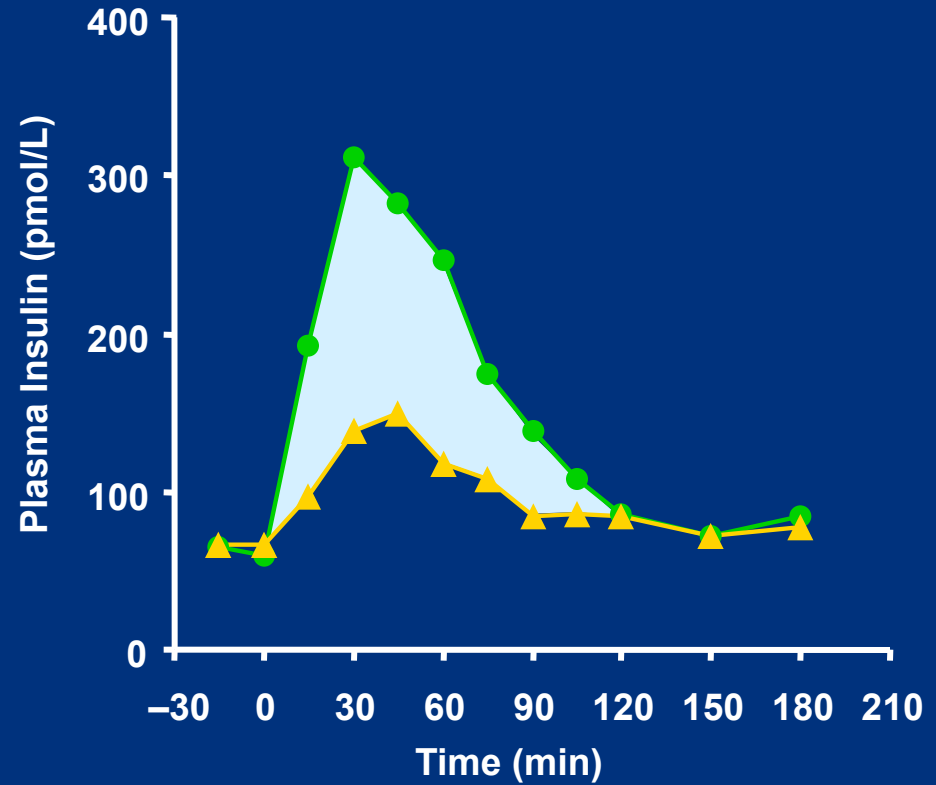

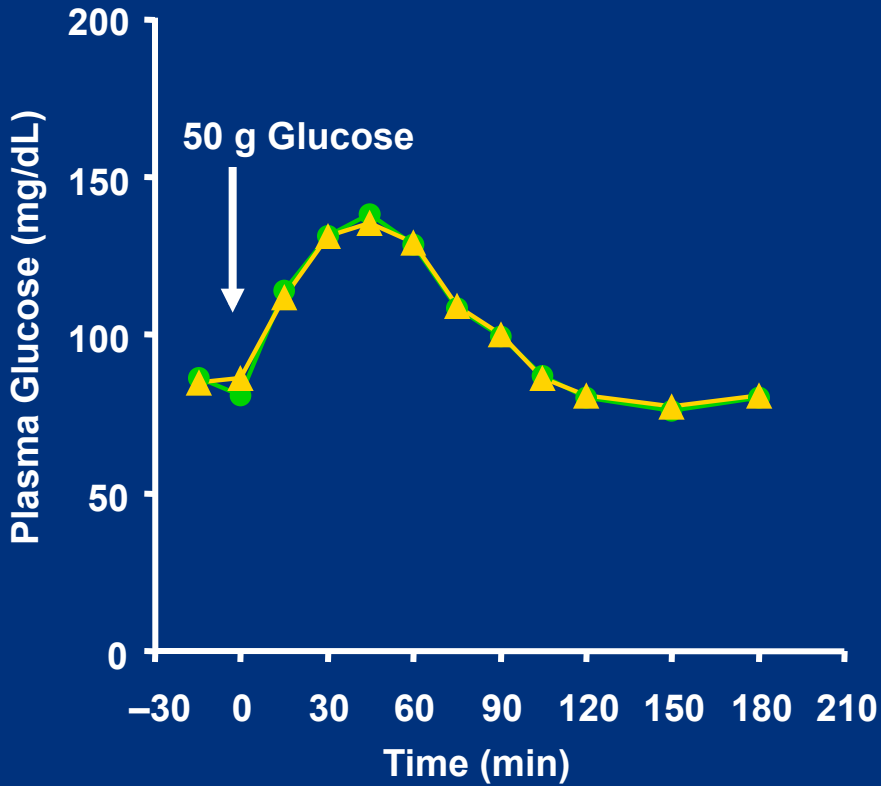

Fat cells are insulin resistant

- ◆ Elevated plasma free fatty acid concentrations and increased levels of toxic lipid metabolites, and thus lipotoxicity
- ◆ These toxic lipid metabolites worsen insulin resistance in muscle and liver and promote beta-cell failure

◆ METFORMIN, PIOGLITAZONE

5. INCRETIN EFFECT

Oral Glucose Tolerance Test and Matched IV Infusion

N=6

● Oral

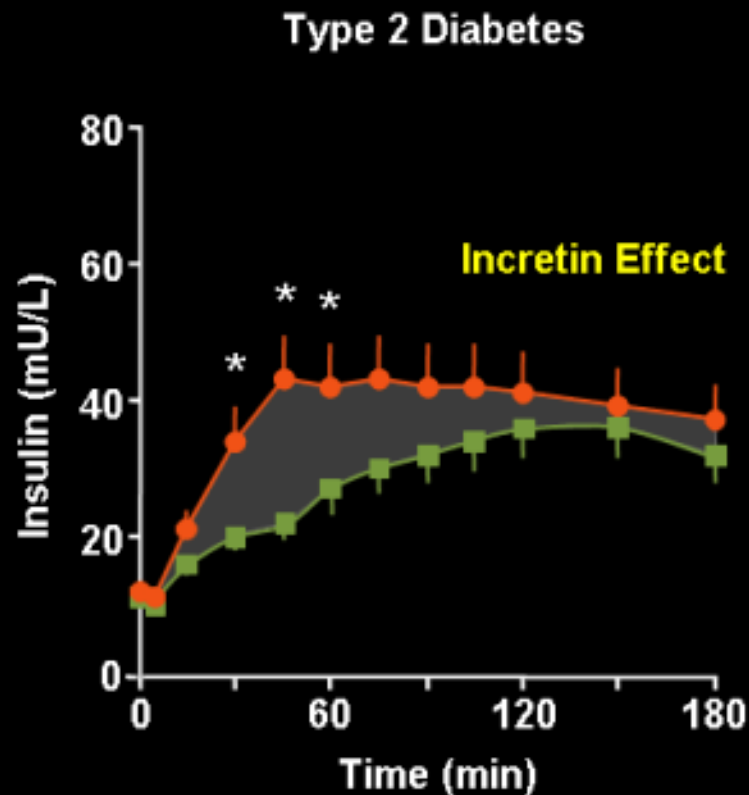

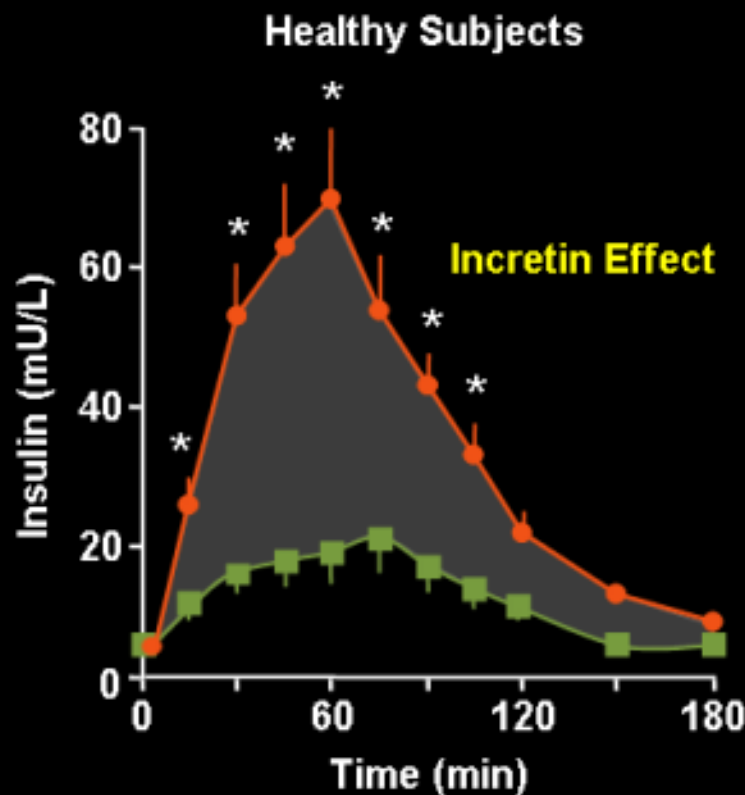

▲ IV

IV=intravenous

Adapted from Nauck MA, et al. *J Clin Endocrinol Metab.* 1986; 63: 492-498.

The Incretin Effect Is Reduced in Type 2 Diabetes

- Oral Glucose
- Intravenous (IV) Glucose

Definition of Incretins

“Gut-derived factors that increase glucose-stimulated insulin secretion”

In·cre·tin

Intestine

Secretion

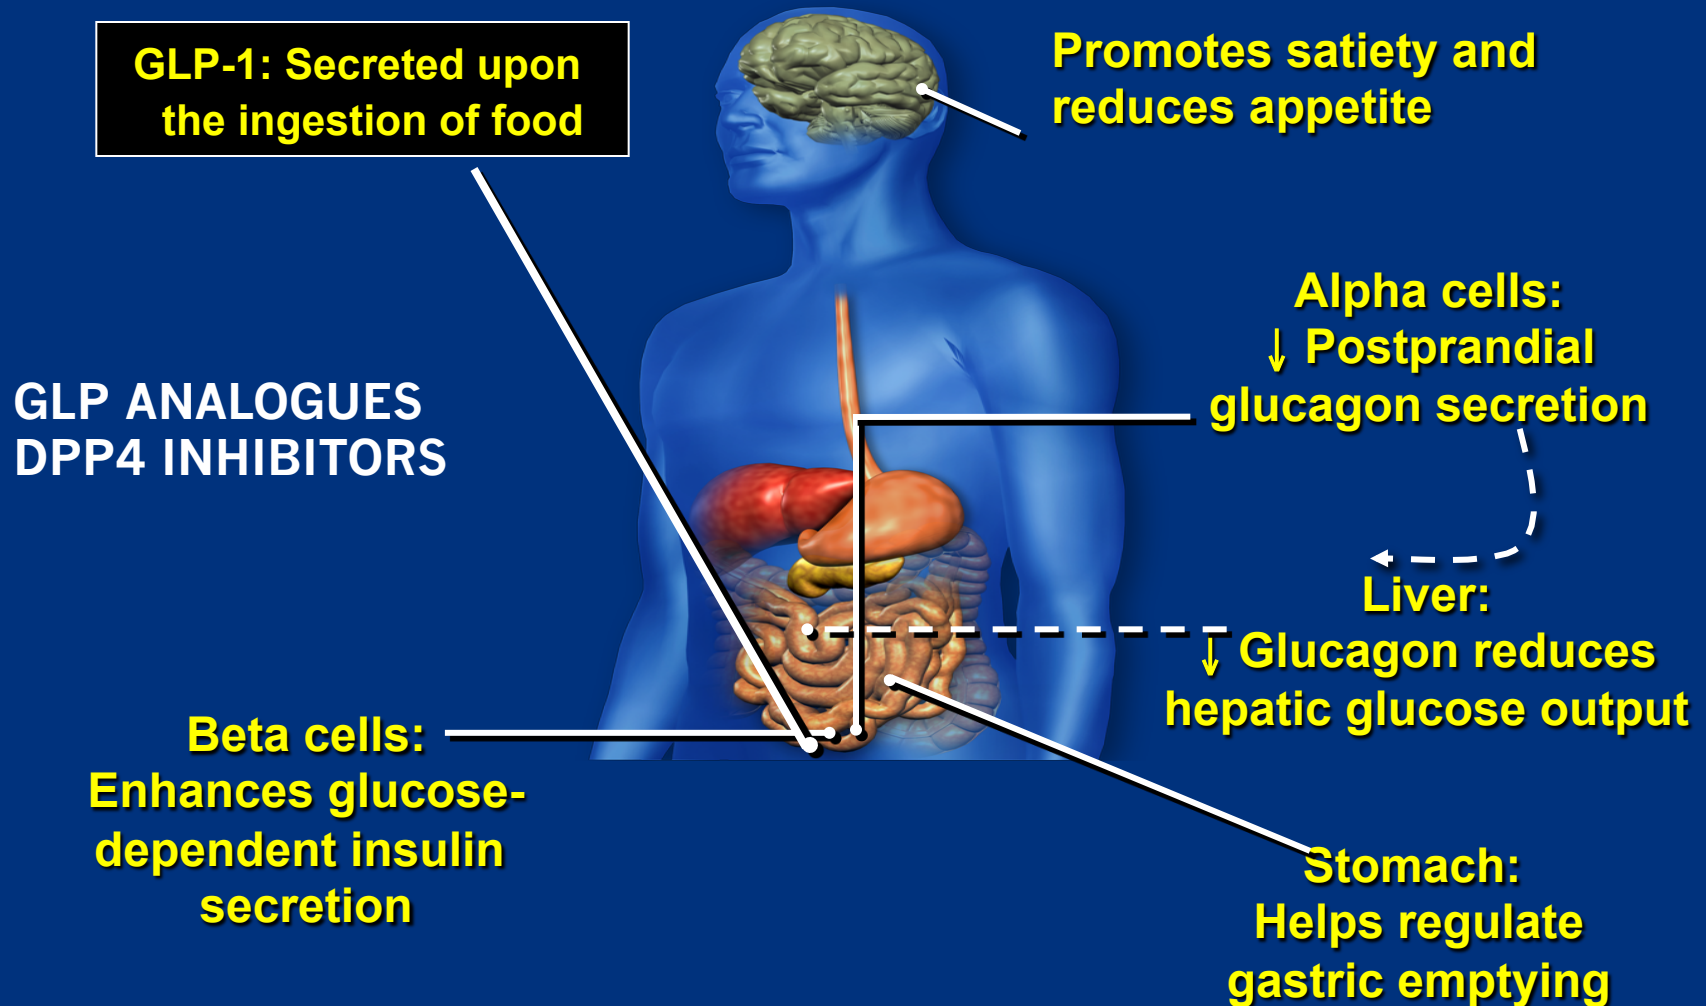

Insulin

Creutzfeldt. *Diabetologia*. 1985;28:5645.

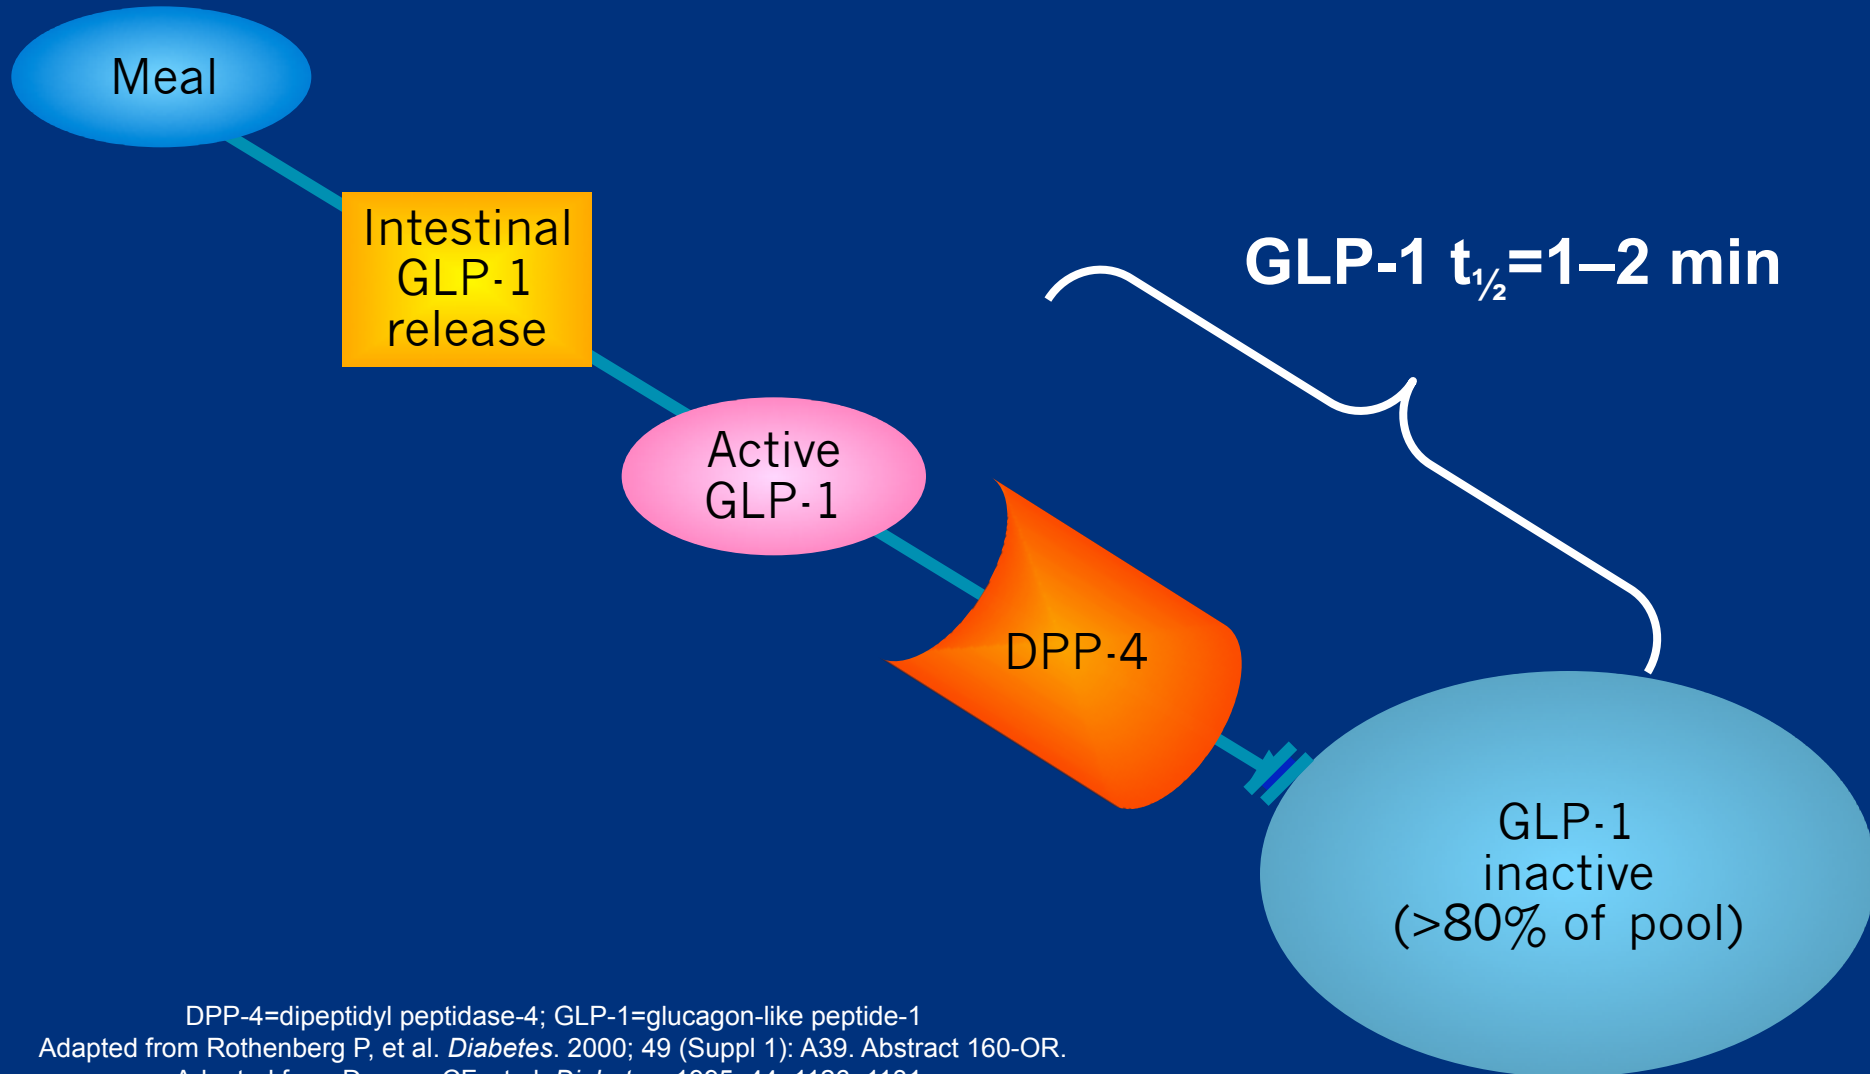

GLP 1- GLUCAGON LIKE PEPTIDE-1

GIP- GLUCOSE INSULINOTROPIC PEPTIDE

GLP-1 Modulates Numerous Functions in Humans

Inhibition of DPP-4 Increases Active GLP-1

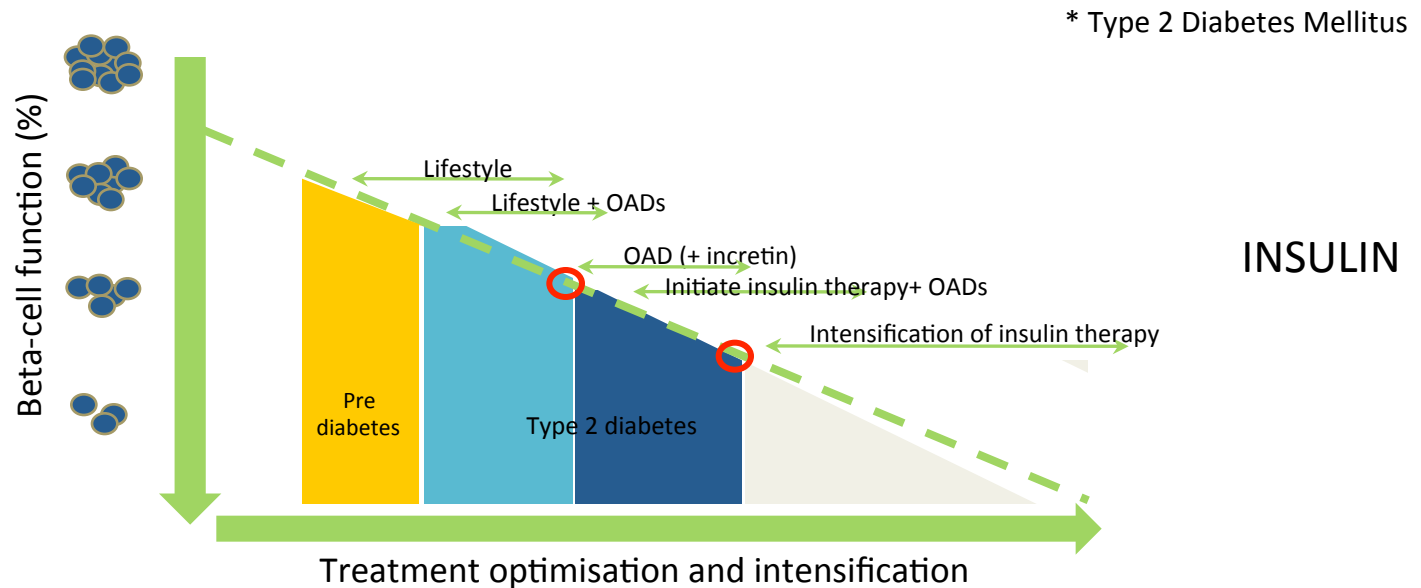

DPP-4=dipeptidyl peptidase-4; GLP-1=glucagon-like peptide-1

Adapted from Rothenberg P, et al. *Diabetes*. 2000; 49 (Suppl 1): A39. Abstract 160-OR.

Adapted from Deacon CF, et al. *Diabetes*. 1995; 44: 1126-1131.

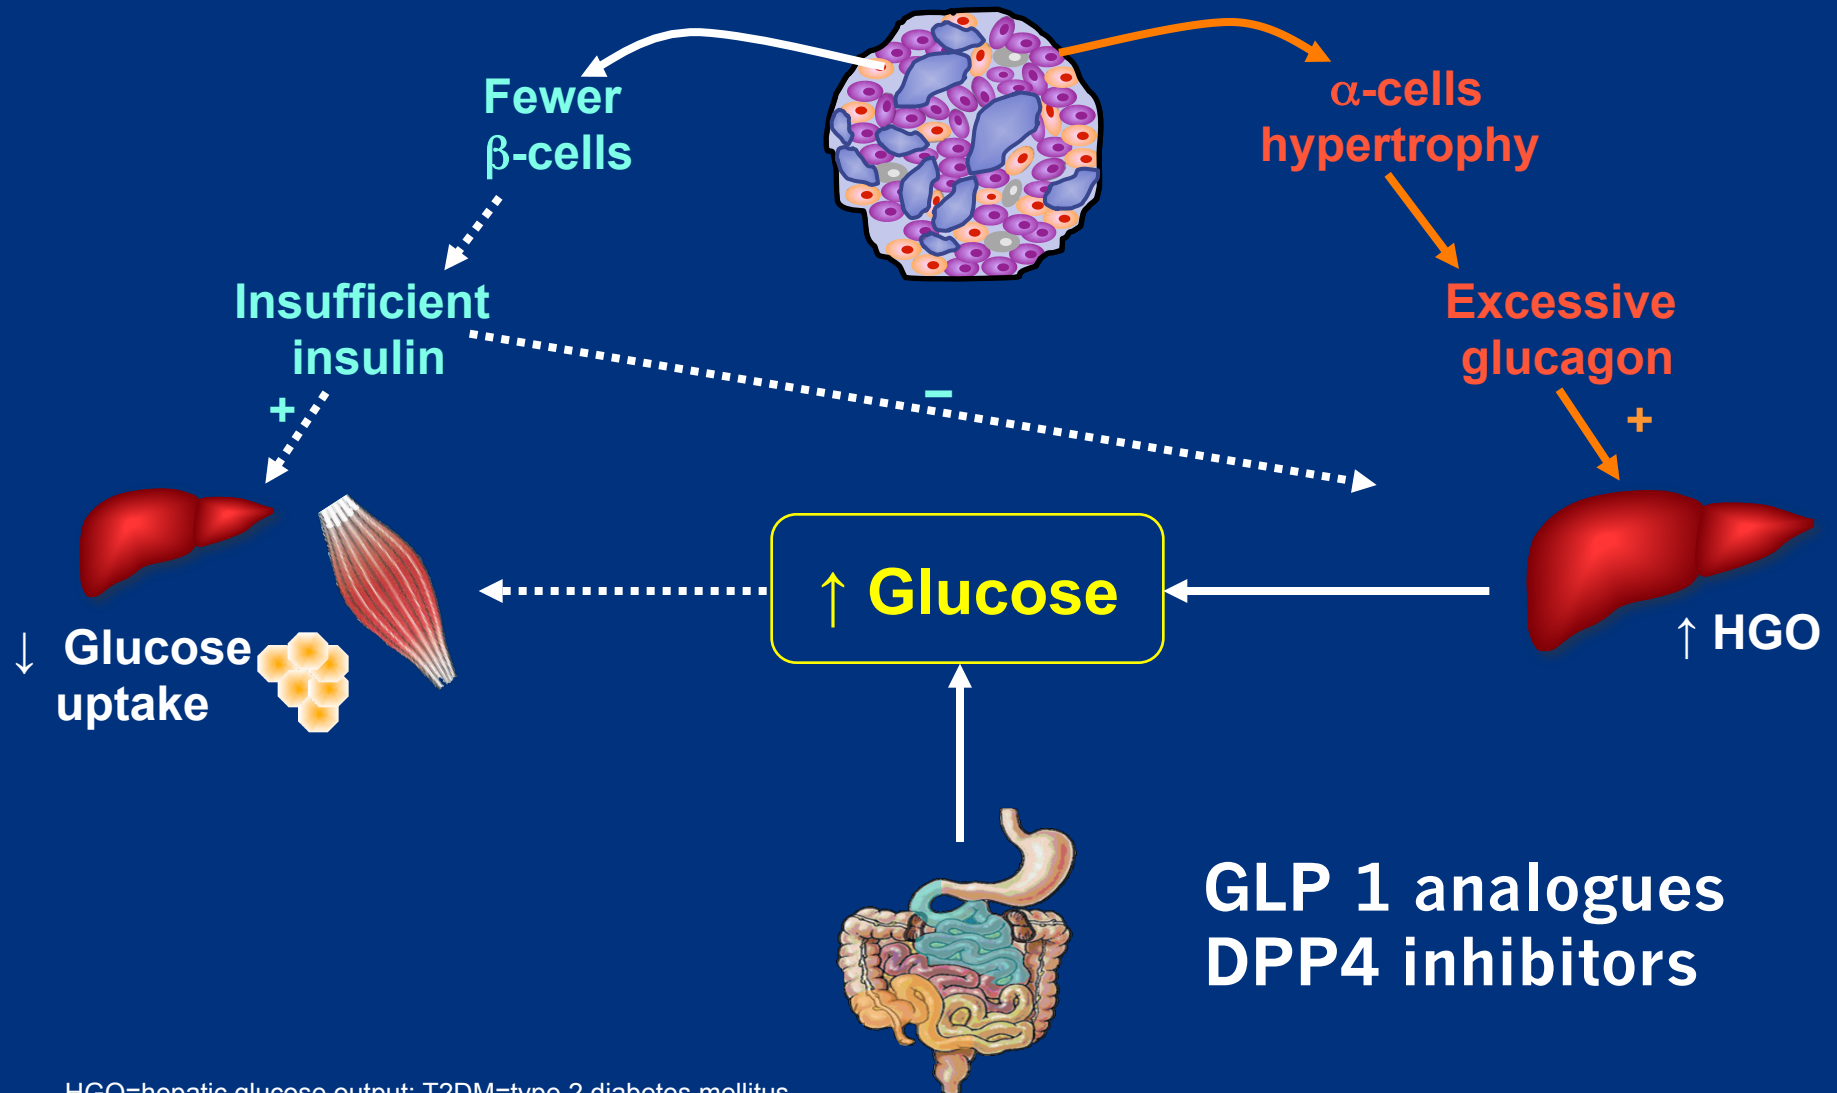

Progressive loss of β -cell function

- T2DM progression is characterised by decline in β -cell function and worsening insulin resistance¹

1. Fonseca VA. Br J Diab Vasc Dis 2008;8:S3; 2. Nathan DM, et al. Diabetes Care 2009;32:193-203; 3. Shimoda M, et al. Diabetologia 2011; 54:1098-1108; 4. Inzucchi et al. Diabetes Care 2012; Published online 19Apr2012; 5. IDF Treatment Algorithm. International Diabetes Federation 2011

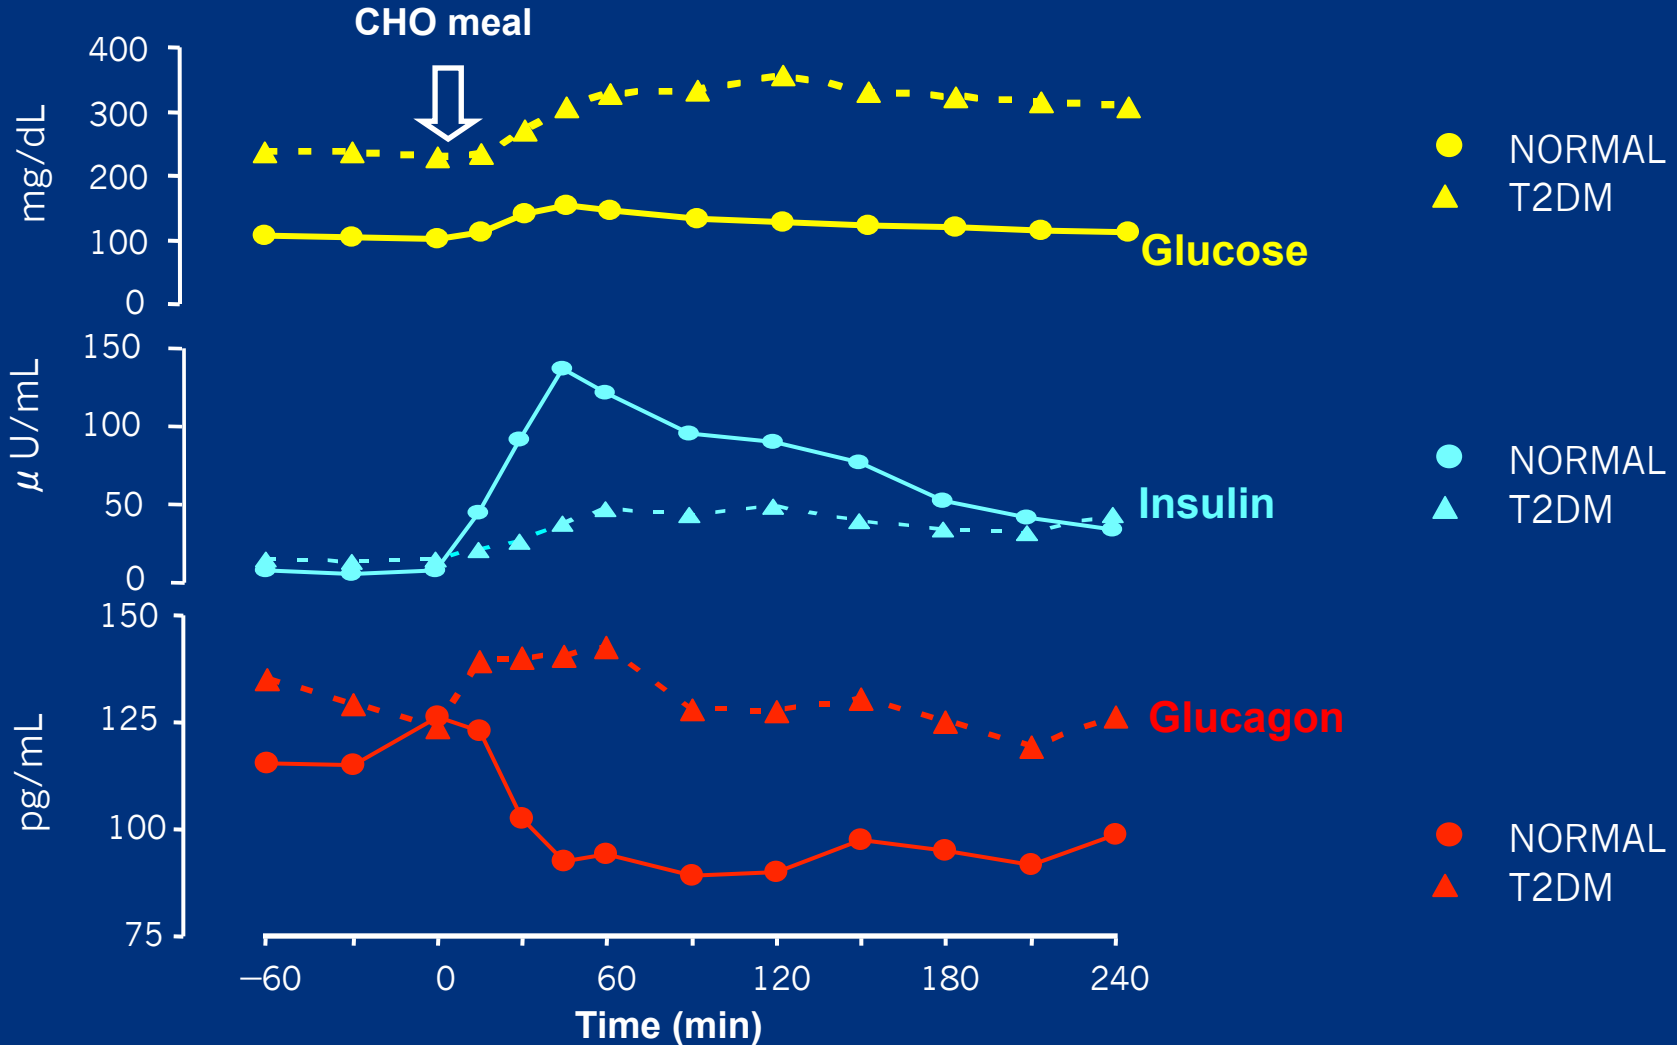

6. Pancreatic Islet Dysfunction in T2DM

HGO=hepatic glucose output; T2DM=type 2 diabetes mellitus

Adapted from Ohneda A, et al. *J Clin Endocrinol Metab.* 1978; 46: 504–510; Gomis R, et al. *Diabetes Res Clin Pract.* 1989; 6: 191–198.

Hyperglucagonemia

CHO=carbohydrate; NGT=normal glucose tolerance; T2DM=type 2 diabetes mellitus
Adapted from Müller WA, et al. *N Engl J Med.* 1970; 283: 109-115.

7. INCREASED RENAL ABSORPTION OF GLUCOSE

180g of glucose is filtered and reabsorbed by the kidneys daily

90% by sodium glucose co-transporter 2 (SGLT2)

10% of this by sodium glucose co-transporter 1 (SGLT 1)

Septicidal septet (the kidney)

The renal glucose threshold (RT_G) is increased in subjects with type 2 diabetes

- ◆ Renal glucose reabsorption is increased in diabetes, which could contribute to further increasing plasma glucose levels

RT_G , renal threshold for glucose excretion.

8. Ominous octet (the brain)

- ◆ Satiety center dysfunction.

???

Reduced GLP levels

Adipokines

- ◆ Obese individuals, both diabetic and non-diabetic, are more insulin resistant with hyperinsulinaemia.
- ◆ Despite hyperinsulinaemia in IGT, obese Insulin resistant people continue eat more, indicating that the appetite centres must be resistant to insulin

??metformin, pioglitazone

??GLP1 Analogues, DPP4 inhibitors

Pathophysiology of T2DM summary

- Multiple defects contribute to the progression of type 2 diabetes mellitus

ANTI-HYPERGLYCEMIC THERAPY

- Therapeutic options: Lifestyle

- Weight optimization

- Healthy diet

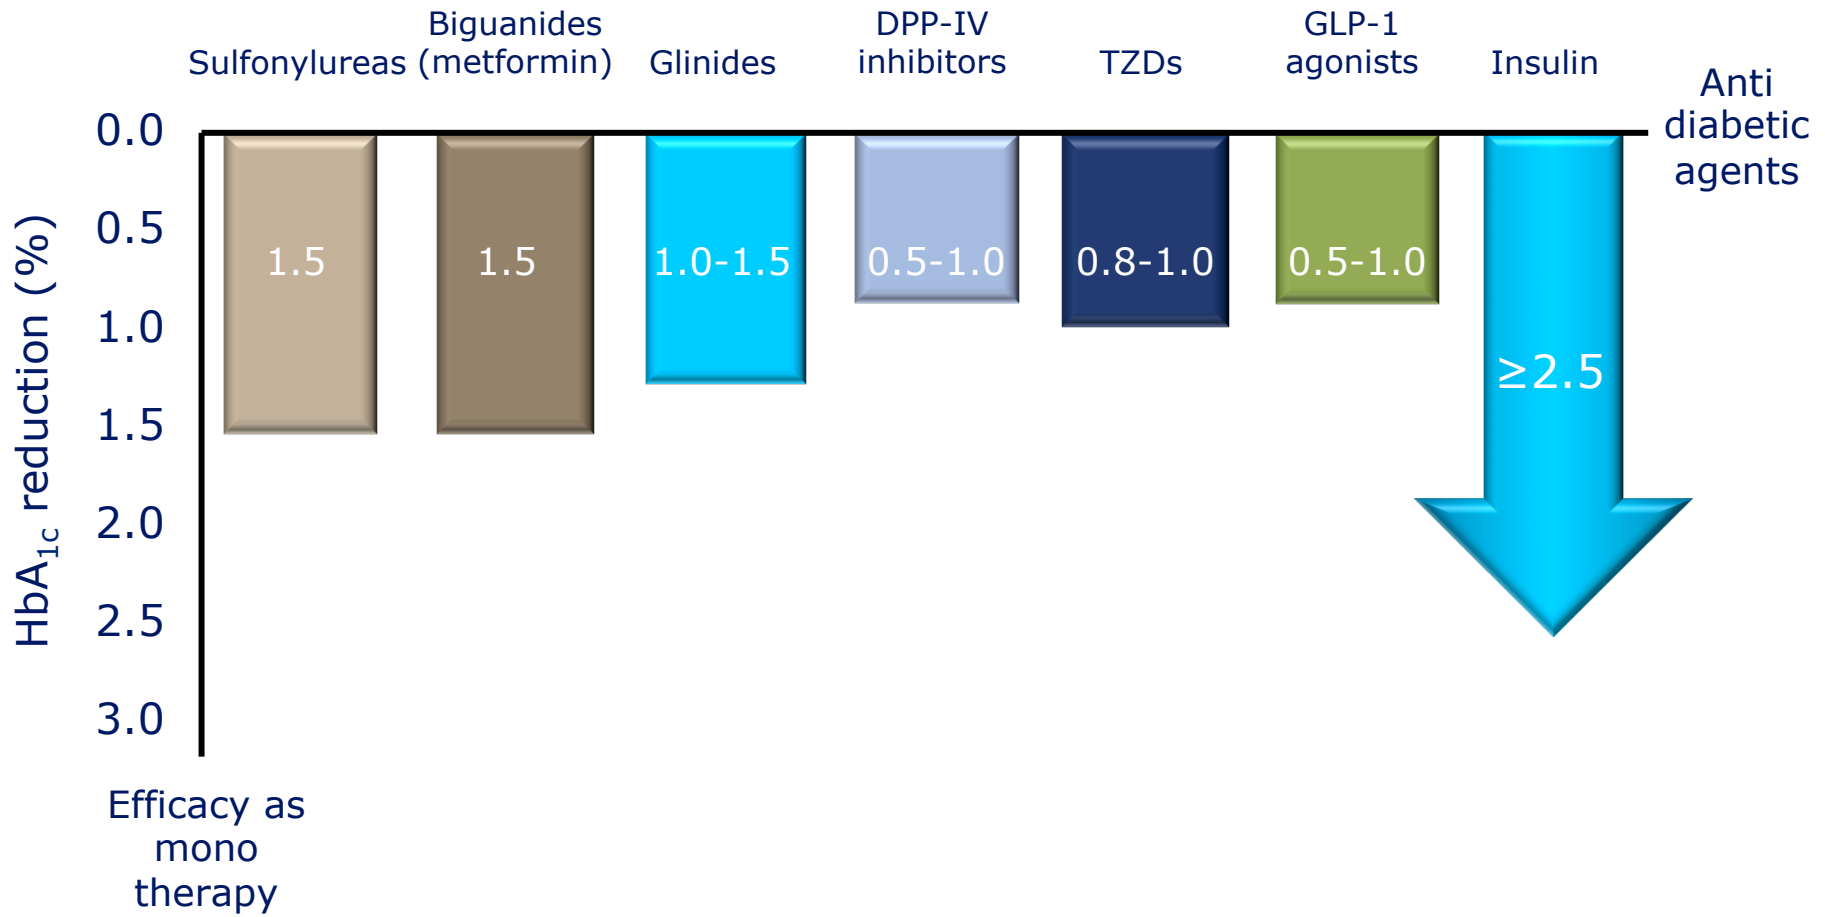

- Increased activity level

Classes of diabetes medications

1. Insulin (1920)
2. Biguanides (1950s)
3. Sulfonylureas (1950s)
4. Thiazolidinediones (TZDs) (1980s, 1990s)
5. α -glucosidase inhibitors (1980s, 1990s)
6. Dipeptidyl peptidase 4 inhibitors (2007, 2008)
7. Meglitinide derivatives (1980s)
8. Amylinomimetics (2005)
9. Glucagon like peptide -1 analogues (2005)
10. Bile acid sequestrants(2008)
11. Dopamine agonists (2009)
12. Selective sodium glucose transporter2 inhibitors(2013)

HbA_{1c} reduction of DM drugs

Adapted from Nathan DM. N Engl J Med. 2007;356:437-40
and Nathan et al. Diabetes Care. 2009;32:193-203

Mono-therapy

Efficacy*
Hypo risk
Weight
Side effects
Costs

Healthy eating, weight control, increased physical activity & diabetes education

Metformin

high
low risk
neutral/loss
GI / lactic acidosis
low

If HbA1c target not achieved after ~3 months of monotherapy, proceed to 2-drug combination (order not meant to denote any specific preference – choice dependent on a variety of patient- & disease-specific factors):

Dual therapy[†]

Efficacy*
Hypo risk
Weight
Side effects
Costs

Metformin +	Metformin +	Metformin +	Metformin +	Metformin +	Metformin +
Sulfonylurea	Thiazolidinedione	DPP-4 inhibitor	SGLT2 inhibitor	GLP-1 receptor agonist	Insulin (basal)
high efficacy moderate risk weight gain hypoglycemia low costs	high efficacy low risk weight gain edema, HF, fxs low costs	intermediate efficacy low risk neutral weight rare side effects high costs	intermediate efficacy low risk weight loss GI, dehydration high costs	high efficacy low risk weight loss GI side effects high costs	highest efficacy high risk weight gain hypoglycemia variable costs

If HbA1c target not achieved after ~3 months of dual therapy, proceed to 3-drug combination (order not meant to denote any specific preference – choice dependent on a variety of patient- & disease-specific factors):

Triple therapy

Metformin +	Metformin +	Metformin +	Metformin +	Metformin +	Metformin +
Sulfonylurea +	Thiazolidinedione +	DPP-4 Inhibitor +	SGLT-2 Inhibitor +	GLP-1 receptor agonist +	Insulin (basal) +
or TZD	or SU	or SU	or SU	or SU	or TZD
or DPP-4-i	or DPP-4-i	or TZD	or TZD	or TZD	or DPP-4-i
or SGLT2-i	or SGLT2-i	or SGLT2-i	or DPP-4-i	or Insulin [§]	or SGLT2-i
or GLP-1-RA	or GLP-1-RA	or Insulin [§]	or Insulin [§]		or GLP-1-RA
or Insulin [§]	or Insulin [§]				

If HbA1c target not achieved after ~3 months of triple therapy and patient (1) on oral combination, move to injectables, (2) on GLP-1 RA, add basal insulin, or (3) on optimally titrated basal insulin, add GLP-1-RA or mealtime insulin. In refractory patients consider adding TZD or SGLT2-i:

Combination injectable therapy

Metformin +	Basal Insulin +	Mealtime Insulin	or	GLP-1-RA
-------------	-----------------	------------------	----	----------

Figure 2. Anti-hyperglycemic therapy in T2DM: General recommendations

Mono-therapy

Efficacy*
Hypo risk
Weight
Side effects

If HbA1c target not achieved after ~3 months of triple therapy and patient (1) on oral combination, move to injectables, (2) on GLP-1 RA, add basal insulin, or (3) on optimally titrated basal insulin, add GLP-1-RA or mealtime insulin. In refractory patients consider adding TZD or SGLT2-i:

Metformin +

Basal Insulin + Mealtime Insulin or GLP-1-RA

Uncontrolled hyperglycemia (catabolic features, BG ≥300-350 mg/dl, HbA1c ≥10-12%)

Combination injectable therapy[‡]

Antihyperglycaemic therapy in type 2 diabetes : general recommendations

Initial drug
monotherapy
Efficacy (\downarrow HbA_{1c})

Healthy eating, weight control, increased physical activity

Metformin

high

In choosing your 2nd option, your clinical judgement considering:

Risk of Weight gain

Risk of Hypoglycaemia

Severity of co-morbidities

Long-term safety of new agents

Cost of medications to the patient

Predominant pathophysiologic defect

Metformin

Poor glucose control is associated with increased risk

Microvascular

Retinopathy and blindness

After 15 years:

- ~40% develop retinopathy
- 2% become blind

Erectile dysfunction

- Up to 75% of male patients

Diabetic foot disease

- 15-40 times more likely to require lower limb amputation

Kidney disease (nephropathy)

- Up to ~1/3 of patients

Neuropathy

- Up to 50% of patients

Poor glucose control is associated with increased risk

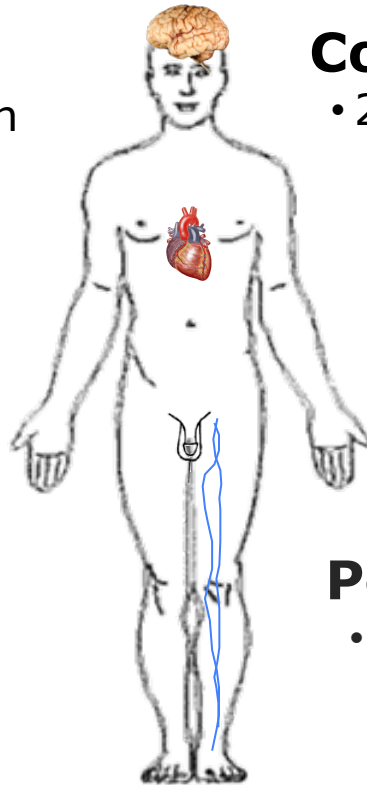

Macrovascular

Stroke

- Occur twice as often

Coronary heart disease

- 2-4 times more likely

Peripheral vascular disease

- ~1/3 of patients

THE EVIDENCE FOR GOOD GLYCEMIC CONTROL

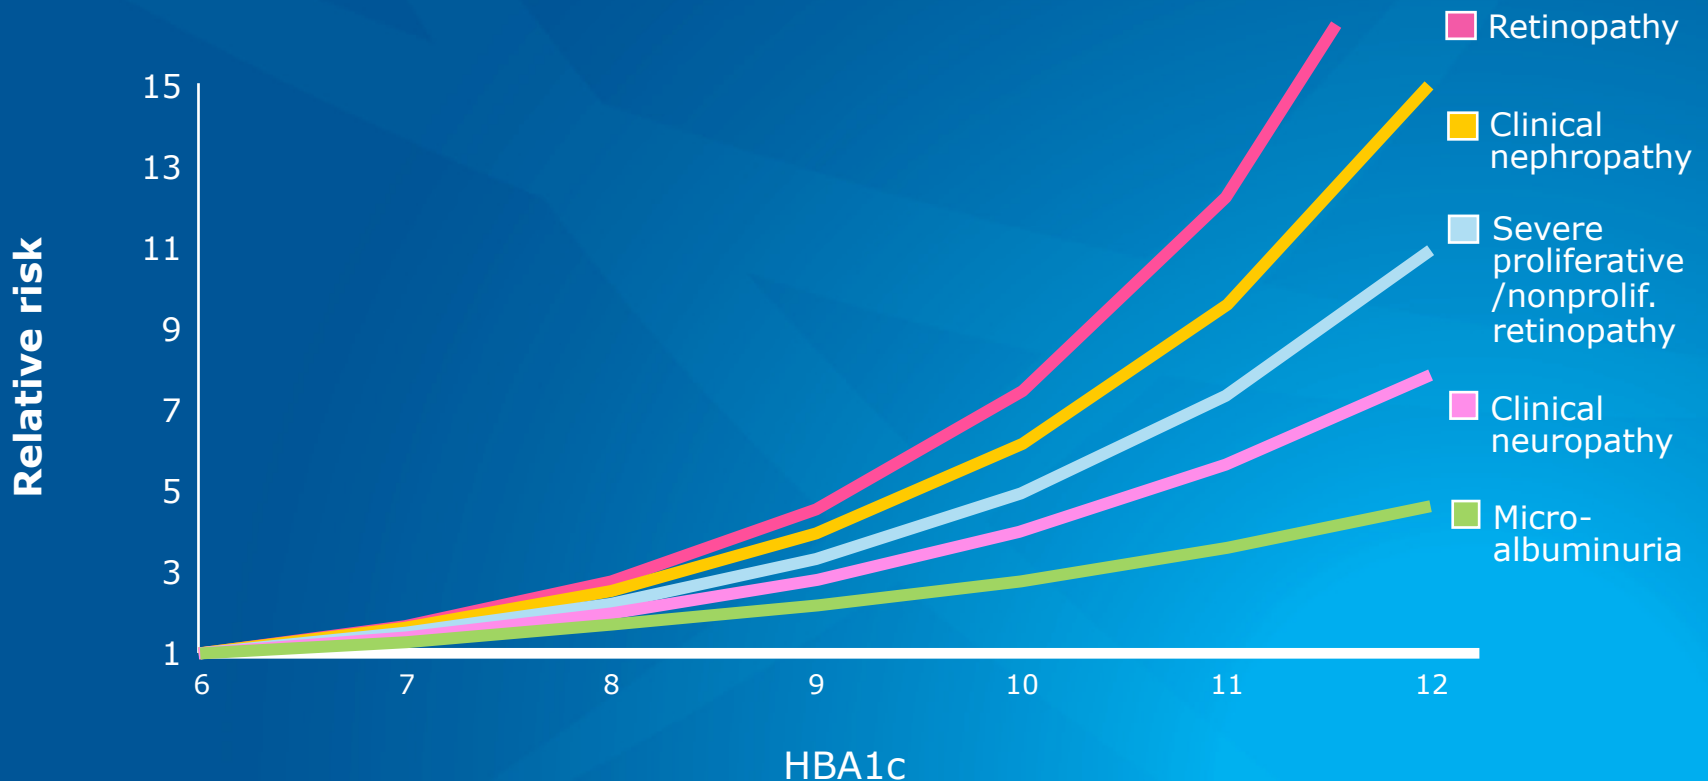

**Diabetes Control and Complications Trial (DCCT)/
Epidemiology of Diabetes Interventions and
Complications (EDIC) for T1DM**

**UK Prospective Diabetes Study (UKPDS) for
T2DM***

- **Newly diagnosed patients were recruited in the study,
intensive vrs conventional**

Relationship between glycaemic control and progression of diabetic complications (DCCT)

DCCT: relative risk of progression of diabetic complications by mean HbA1c

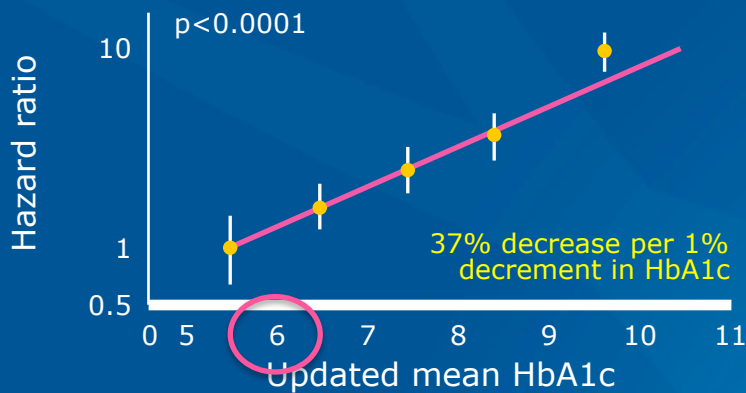

NB: stylised graph in which the RR of each complication has been set to 1.0 at an HbA1c of 6%

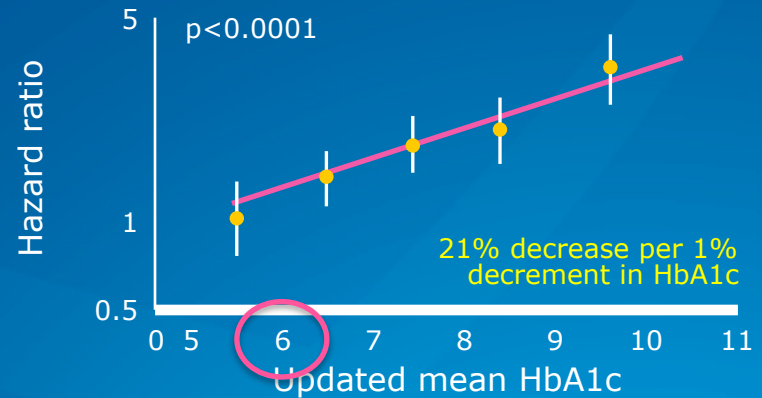

UKPDS

There is a clear epidemiological relationship between HbA_{1c} level and complications in type 2 diabetes,

Microvascular endpoints

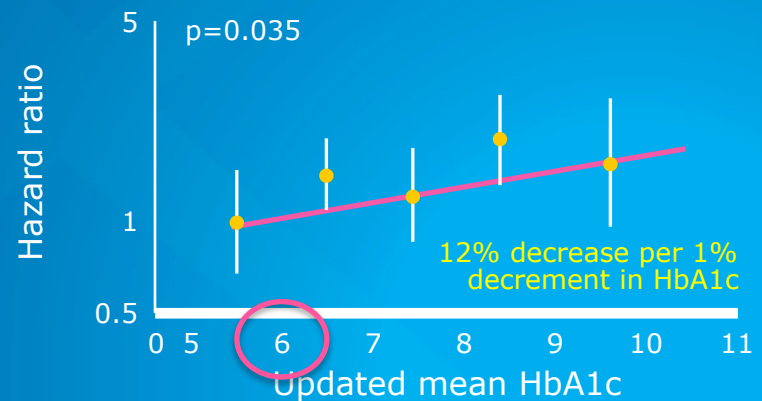

Diabetes-related deaths

Fatal and non-fatal myocardial infarction

Fatal and non-fatal stroke

WHAT HAPPENS YEARS AFTER BEING IN THE INTENSIVE ARM?

After the UKPDS and DCCT patients were now taken care of by GPs with normal follow up. Even with subsequent deterioration in glycemic control.

UKPDS- Benefits of “earlier intensive” control continued up to 8.5 years after the trial

DCCT-EDIC – benefits of earlier control continued up to 14 years after the trials.

UKPDS showed "THE LEGACY EFFECT"

1. Holman RR, et al. N Engl J Med. 2008;359:1577-89.
2. UKPDS Study Group. Lancet. 1998;352:837-53.

For glycemic control:

- **Intensive** treatment was better
- **Early intensive** treatment was preferred

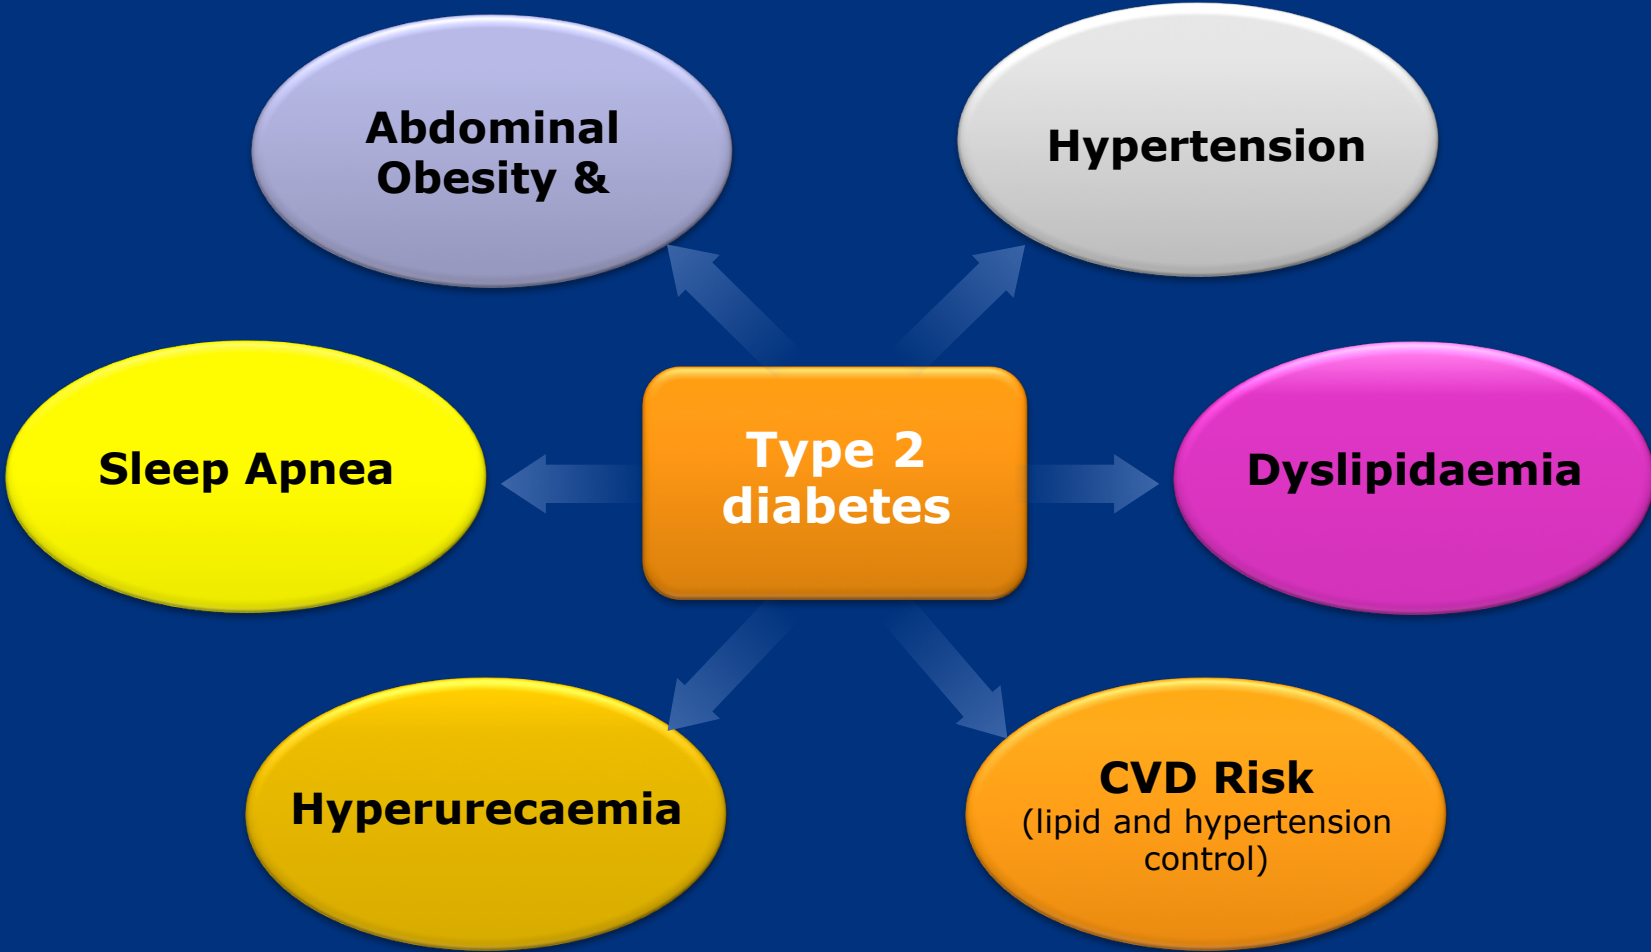

Glycemic targets were revised- FBG, PPG, HBA1c

LEGACY EFFECT/ METABOLIC MEMORY

Early intensive glycemic control confers extended reduction in complications, even when control deteriorates later on

PRESENTING THE EVIDENCE - MACROVASCULAR

Postgrad Med. 2009 May;121(3 Suppl 1):7-12

WHAT DO WE MEAN BY INTENSIVE?

TIGHT CONTROL

GETTING TO TARGET

FBG, PPG, HBA1c

HbA1c as a Monitoring tool

Hb + glucose react non enzymatically to form glycated derivatives , levels are dependent on average glucose levels

–It indicates the average blood glucose over the past 120 days

Glycemic Targets

	ADA ¹	ACE ²	IDF ³
HbA1c	<7.0% <i>(general goal)</i>	≤6.5%	<6.5%
Preprandial capillary plasma glucose	70–130 mg/dL (3.9–7.2 mmol/L)	<110 mg/dL (<6.0 mmol/L)	<110 mg/dL (<6.0 mmol/L)
Peak postprandial capillary plasma glucose	<180 mg/dL (<10.0 mmol/L)	<140 mg/dL (<7.7 mmol/L)	<145 mg/dL (<8.0 mmol/L)

ACE=American College of Endocrinology; ADA=American Diabetes Association; IDF=International Diabetes Federation

Adapted from: ¹ADA / EASD consensus statement: Nathan DM, et al. *Diabetes Care*. 32:193–203;

²American Association of Clinical Endocrinologists, American College of Endocrinology. *Endocr Pract*. 2002; 8 (Suppl 1): 5–11;

³International Diabetes Federation. *Global Guideline for Type 2 Diabetes*. Brussels: International Diabetes Federation; 2005.

Global targets for glycaemic control

FPG
<110 mg/dL
(6.0 mmol/L)

HbA_{1c}
<7.0%

PPG
< 145 mg/dL
(8.0 mmol/L)

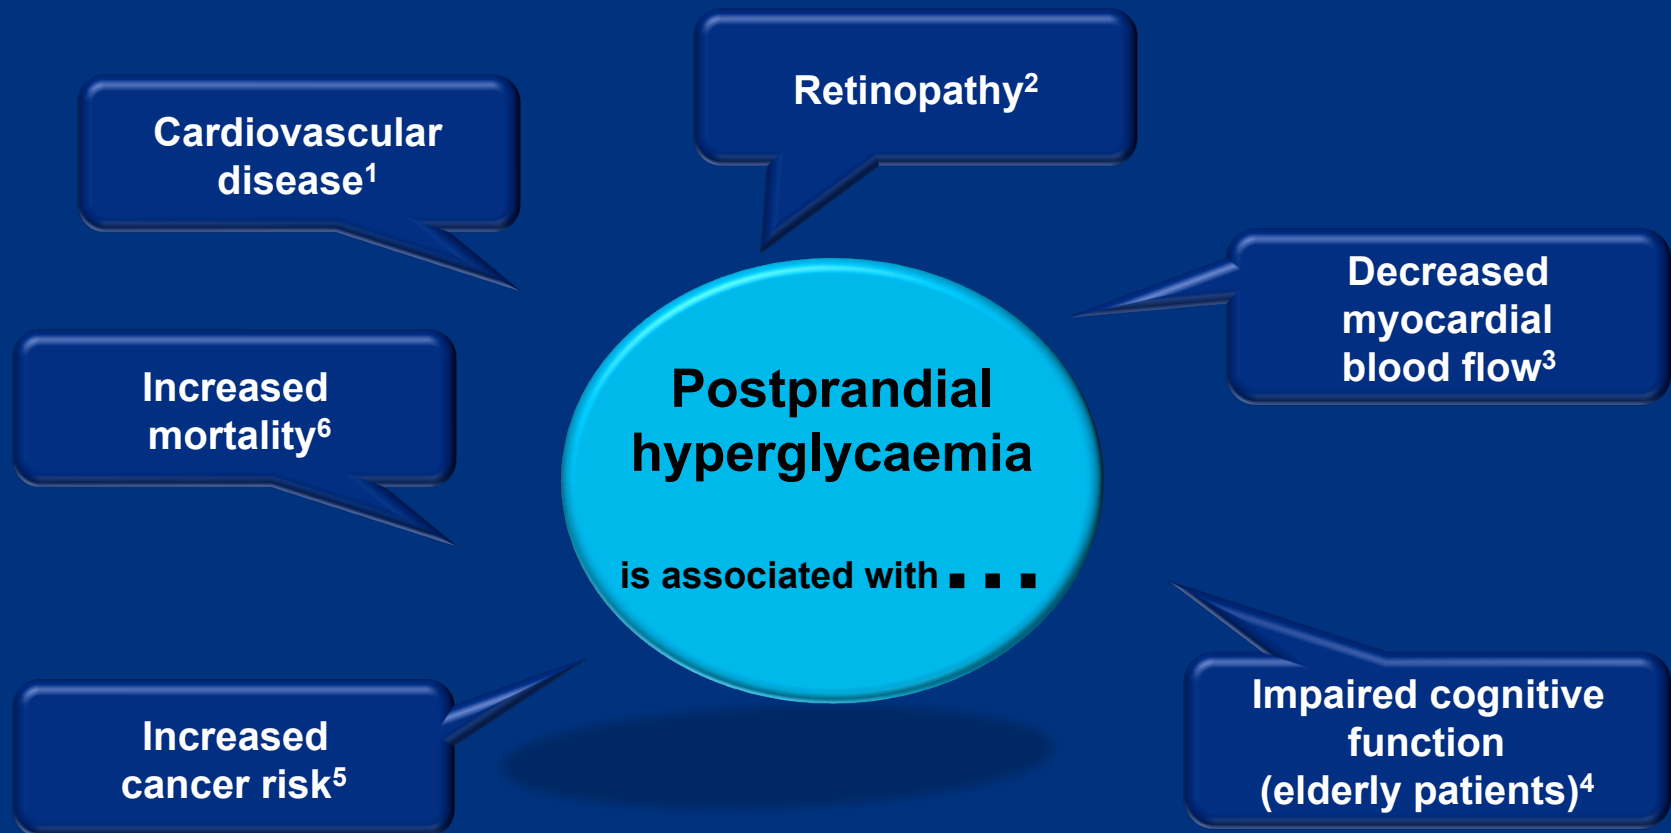

- Less stringent targets:
 - In older population could be less stringent
 - Comorbid cardiac disease

POSTPRANDIAL HYPERGLYCEMIA

- 36yr male patient
- HBA1c-10%

FPG	PRE LUNCH	2HPP	PRE SUPPER	2HPOST SUPPER
6.8	10.7	14.3	13.4	11.2

Risks of postprandial hyperglycaemia

1. Cavalot F et al. J Clin Endocrin Metab 2006; 91:813–819

2. Shiraiwa T et al. Diabetes Care 2005;28:2806-2807

3. Scognamiglio R et al. Circulation 2005; 112(2):179-184

4. Abbatecola AM et al. Neurology 2006; 67(2):235-240

5. Stattin P et al. Diabetes Care 2007; 30:561-567

6. Hanefeld M et al. Diabetologia 1996;39:1577–83

Same HbA_{1C}s are really not the same

- There is a variable relationship between fasting glucose, postprandial glucose and HbA_{1C}
- Hypothetically on the same dose of diabetes medications

Summary of management

- **Individualized treatment and involve patients**
- **(Lifestyle +metformin) + (any other) depending on patient and pathophysiology at play**
- **Ultimately, patients will require insulin**
- **Comprehensive risk management**

CHALLENGES IN DIABETES/ GLYCEMIC CONTROL

When to convince the patient to shift from orals to insulin-2

Difficulty in convincing patients to accept/switch to insulin injections-3

Initiation of insulin/understanding proper use of insulin-2

Storage of insulin 2

DUMSOR affecting insulin storage-

Compliance to medication-25

Default to follow up

Adhering to nutritional recommendations-5

CHALLENGES IN DIABETES/ GLYCEMIC CONTROL

Insulin marks the beginning of the end

Effective medication-for individuals

What drug to start with-2

What to add on

Medication choice

Medication choice when a1c is out of control but FBS is normal

Medication choice in elderly

Medication choice in renal complication

CHALLENGES IN DIABETES/ GLYCEMIC CONTROL

Literacy level of patients

Managing DKA 2

Patients Prefer herbal

Lack of evidence based data

Lack of management protocols in Ghana

Diagnostic criteria

Cost of a1c

Cost of SMBG

Complications

CHALLENGES IN DIABETES/ GLYCEMIC CONTROL

Obesity

Unavailability of dietician

Diet not well understood-4

Adhering to physical activity recommendations-4

Financial constraints-13/cost of medications

When to intensify treatment-2

Achieving good glycaemic control-5

CHALLENGES IN DIABETES/ GLYCEMIC CONTROL

Diabetic nephropathy

Management of hypertension and dyslipidaemia

Patient misinformation 3

Poor education on diabetes-4

Pill burden

What is a suitable well controlled point for T2DM patients (TARGETS)

Challenges in reaching desired glycaemic targets-4

Challengesmy opinion

Cost

Provider education

Lack of guidelines

Clinical inertia in intensification

AT THE END OF THIS PRESENTATION.....

Epidemiology- its an epidemic now

Current thinking of aetiopathogenesis- diabetic octet

Advances in management for best glycemic control-

- Individualize
- Treat to target
- Insulin for all (if they live long enough)

Challenges preventing attainment of good glycemic control-
